

CONSENT FORM COVER SHEET

Study title: Evaluation of Post-Vaccinated Neutralizing Antibodies following the Pfizer COVID Vaccine

Principal investigators: Beverly Ogden, M.D.
Karen Elkind-Hirsch, MS, Ph.D.

You may be eligible to take part in a research study. Taking part in this study is *completely voluntary*. It is up to you whether or not to take part in this research study. Even if you decide to join the study today, you are free to leave at any time if you change your mind.

This form contains information to help you make a decision about whether or not to take part in this study. All of this information is important, but here are some key points to help you make a decision:

- This is research. The purpose of this study is to determine the rise in antibody production following the Pfizer COVID vaccine administration. You are being asked to be in this study because you have taken the Pfizer COVID vaccine
- Your time in this study will last for approximately 1 year after your first vaccine injection.
- You will be asked to give 5 blood and saliva samples over 1 year after your first vaccine shot
- The main risks for taking part in this study are no different from those in taking blood for regular blood tests. A needlestick in your arm may cause local pain, bruising and swelling, as well as lightheadedness, dizziness and rarely, fainting and/or a local infection
- The main benefits you may receive if you decide to take part are that the information from the post-vaccination antibody tests may help predict your response to the vaccination.
- You do not have to be in this study to get vaccinated. Your participation is voluntary and if you decide not to enter this study, you will still get the vaccine.

Please take the time to read this entire form. Please ask any questions you have about the study. You may also wish to discuss this study with your family, friends, and doctor to help you make a decision about taking part.

If you decide to take part in the study, you will be asked to sign this form.
